BRIDGEFORM single-sack wellbore strengthening system

Improves drilling efficiency and controls subsurface losses in differentially pressured formations

The BRIDGEFORM™ single-sack wellbore strengthening system uses a custom-engineered formula to improve wellbore stability in differentially pressured formations. The BRIDGEFORM technology is the next generation of the field-proven Baker Hughes, a GE company (BHGE), MAX-BRIDGE™ advanced bridging solution. The BRIDGEFORM system significantly reduces induced losses and has the ability in certain applications to eliminate casing by combining two sections with different pressure profiles. The BRIDGEFORM system mitigates the risk of differential sticking while maximizing wellbore stability and enhancing rates of penetration.

The dry, single-sack BRIDGEFORM system not only eases logistics and mixing, but also improves performance and efficiency. The system is equally effective in both water-based and oil-based systems, showing minimal effect on rheology while also maintaining emulsion stability in oil-based mud (OBM) systems. Additionally, it also reduces high-pressure/high-temperature (HP/HT) fluid loss, minimizing formation damage through its “low invasion/spurt loss” mechanism.

Recommended treatment levels
The BRIDGEFORM system can be applied directly to the hopper with concentrations ranging from 5 to 20 lbm/bbl to be maintained in the system based on drilling conditions. Sweeps can be done using 30 to 50 lbm/bbl as needed. BRIDGEFORM is the preferred combination with BHGE AutoTrak Curve™ rotary steerable system.
